# Variables

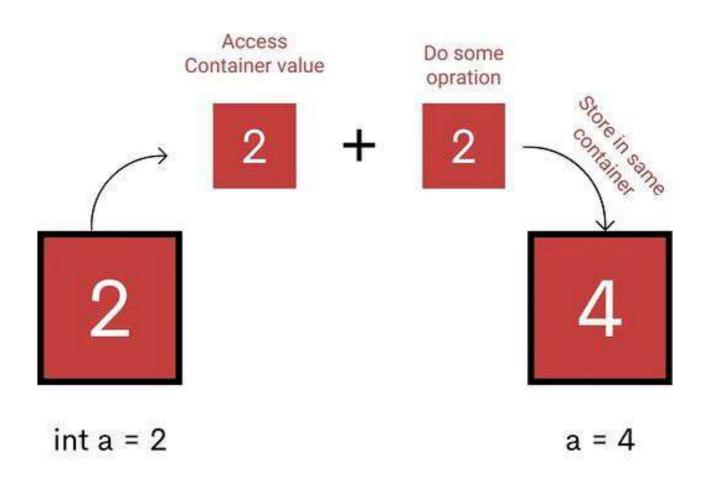

### **Variables**

Variables are like a container where we can store the data

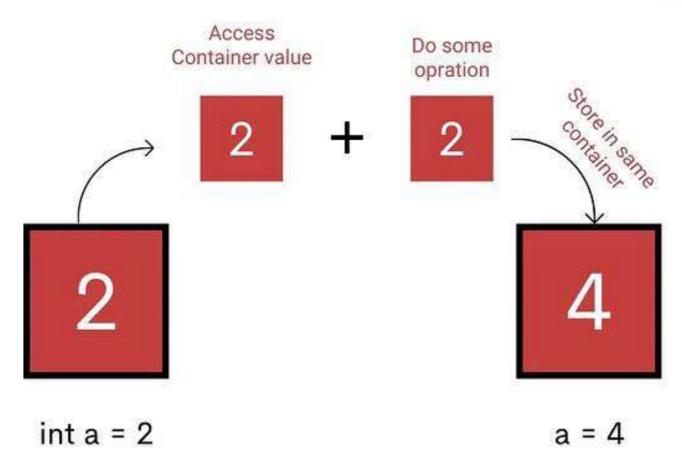

## Operation on Variable

```
##-- IN PROGRAMMING --##

int a = 2;
a = a + 2;
print(a);
```

### Variables Declaration

In Programming, we follow a syntax for declaring a variable

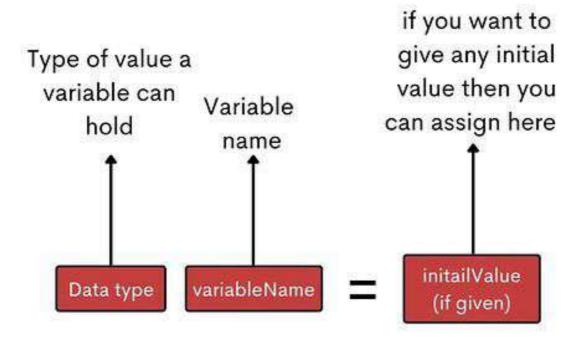

Syntax for declaring a variable

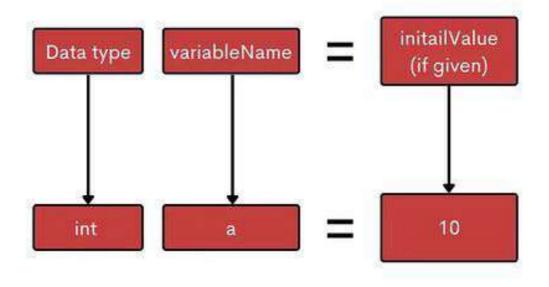

Syntax for declaring a variable

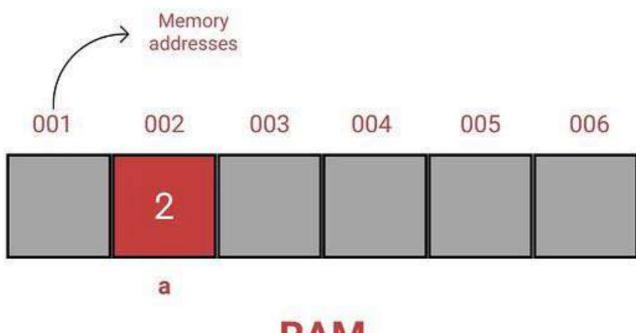

### Variable Representation in Memory

In Computer RAM is used to store everything so when we declare a variable in programming (int a =2) in backend, the processor will go to the RAM and access any random block of memory and store the initial value in it

RAM
